Answer: B

QUESTION: 118

Which of the following catalog tables in the test environment should the DBA query to calculate the number of data sets to be added to production prior to migrating a new database?

- A. SYSTABLES and SYSINDEXES

- B. SYSTABLEPART and SYSINDEXPART
- C. SYSTABSTATS and SYSINDEXSTATS
- D. SYSTABLESPACE and SYSINDEXSPACE

Answer: B

QUESTION: 119

A disk hardware failure error occurs, making the data that resides on this volume unavailable. Which of the following steps is important to make the data available to the applications?

- A. Add a new volume to the storage group.
- B. Use the RECOVER utility to recover the disk from the last disk copy using DFSMS.
- C. Unload the data from the volume, re-create the affected tables, and reload the data.
- D. Run the RECOVER utility to restore the data using the last full image copy and the log.

Answer: D

QUESTION: 120

Running accounting classes 1 and 2 for performance analysis is recommended for which of the following reasons?

- A. DB2 time can be separated from application time.
- B. A detailed view of the access path is reported.
- C. Detail is reported on the I/O wait time.
- D. Detail is reported down to the package and DBRM level.

Answer: A

QUESTION: 121

A system administrator with SYSADM authority needs to grant specific privileges to over 100 DBAs in their shop. The DBAs are organized into five functional groups, and each group requires different access privileges. To minimize the number of GRANT statements to issue, which of the following is the best solution from a maintenance point of view?

- A. Assign the DBADM privilege to each DBA.
- B. Grant necessary privileges to each DBA individually.
- C. Set up primary AUTHIDs, and associate each DB2 user ID for each DBA with a primary AUTHID. Grant necessary privileges to the primary AUTHID
- D. Set up secondary AUTHIDs, and associate each DB2 user ID for each DBA with a secondary AUTHID. Grant necessary privileges to the secondary AUTHID

Answer: D

QUESTION: 122

Given the following EXPLAIN results:

TNAME	METHOD	ACCESS_	ACCESS_	JOIN_	JOIN_	
		DEGREE	PGROUP_ID	DEGREE	PGROUP_ID	T1
	0	3	1	(null)	(null)	
T2	1	3	1	3	1	

Which of the following describes the access being performed?

- A. Merge scan join that initiates a total of 3 concurrent tasks.
- B. Merge scan join that initiates a total of 9 concurrent tasks.
- C. Nested loop join that initiates a total of 3 concurrent tasks.
- D. Nested loop join that initiates a total of 9 concurrent tasks.

Answer: C
